PHILADELPHIA, PA.

Vol. XXXV.      APRIL, 1930.      No. 4

## GENERAL SUMMARY.

Temperatures were mostly seasonable during April, excepting a cold period on the 23d and 24th when they averaged about 15 degrees below the normal with freezing at night in all parts of the State. The rainfall averaged about four-fifths of the April normal with deficiencies reported from nearly all stations. The shortage accumulated during the last half of the month, there being a slight to moderate excess in most sections during the first two weeks. Light snows, or snow flurries, occurred in nearly all parts of the State with heavy snows in some of the northwestern counties. The heaviest snows were in Warren and Erie counties. The freezing of the 23d and 24th did much damage to orchard fruits and to garden truck. The extent of the fruit damage depended upon the stage of advancement in each locality. Peaches and cherries generally suffered the most as they were in full bloom, being in the last stages of the bloom in the southeastern counties, and just coming into full bloom elsewhere. Apples were in various stages of advancement from swelling buds to blossoms with resulting heavy losses in some sections, while others suffered very little. A large portion of the plums came into bloom after the freeze. The Federal-State Crop Reporting Service estimated a loss of more than one-half of the peaches, and about one-third of the apple crop. The losses in the fruit crop were much more serious than the losses of garden truck. Wheat and rye were generally in good condition at the end of the month, and pastures and meadows had made a good start. Oats seeding was nearly finished in the central and southern counties, and was in full swing in the northern tier of counties. Early varieties of field potatoes were mostly planted. Corn ground was being prepared for planting.

## TEMPERATURE.

The mean temperature for the State, as determined from reports of 87 stations, was 48.2° which is 0.6° colder than the normal. The highest monthly mean was 54.6° at Newell and the lowest 41.4° at Gouldsboro. The highest temperature recorded during the month was 92°, at Donora on the 11th, while the lowest, 9°, was registered at Corry on the 9th and also at Ebensburg on the 24th. The greatest daily range of temperature was 56° at Hyndman on the 10th and also at Franklin on the 11th.

## PRECIPITATION.

The average precipitation for the State, as shown by reports of 133 stations, was 2.71 inches, which is a deficiency of 0.66 inch as compared with the April normal. The greatest monthly amount was 4.43 inches at Emporium, and the least 0.66 inch at Ebensburg. The greatest amount recorded in any 24 consecutive hours was 2.52 inches at Gordon on the 6-7th.

Snowfall for the month averaged 1.1 inches, which is 1.7 inches less than normal. The greatest monthly amount was 11.2 inches at Warren and the greatest 24-hour snowfall was 8.6 inches at Corry on the 7th.

VOL. XXXV. MAY, 1930. No. 5

## GENERAL SUMMARY.

May was abnormally warm and dry. The first decade was intensely warm, and a large temperature surplus accumulated. This was largely depleted during the last week which was unseasonably cold with frost or freezing in nearly all parts of the State. The middle of the month was mostly seasonable. The first half of the month was very dry, and no general rains occurred until the 14th, when a rainy week set in. During this drought, forest fires broke out in great numbers, and the damage was the greatest that had been experienced in recent years. The drought stunted the growth of crops generally, but considerable recovery was made from the 14th to the 20th inclusive when daily rains occurred at most places. Pastures and meadows suffered most from the drought, and became short and thin. Alfalfa was fair to good in most places, but the other grasses, including clover, were mostly poor. Wheat continued in a fairly healthy condition, but headed on short straw. Frosts and freezing near the close of the month caused serious damage to crops and to orchard fruits. Corn was badly frozen in some sections, and it was estimated that, for the State as a whole, about one-fourth of the crop would need to be replanted. Truck crops were badly damaged, excepting the extreme southeastern corner of the State, and where no actual freezing occurred the growth was slowed up materially. Orchard fruits had suffered from frosts during the blooming period in April, and were further depleted by this freeze. In some localities practically all of the fruit dropped from the trees. For the State as a whole it was estimated that apples would yield about one-half of a normal crop, while peaches would not exceed a third of a crop. Sunshine for the month was above the normal in all districts.

## TEMPERATURE.

The mean temperature for the State, as shown by the reports from 89 stations, was 61.2°, which is 1.7° above the normal for May. The highest monthly mean was 67.0° at Holtwood, and the lowest, 54.6° at Gouldsboro. The highest temperature recorded during the month was 99° at Phoenixville on the 7th, while the lowest, 25°, was recorded on the 27th at Ridgway, and on the 30th at Somerset. The greatest daily range of temperature for the month was 56°, at Clearfield on the 4th, and at Lancaster on the 5th.

## PRECIPITATION.

The average precipitation for the State, based on the reports from 135 well-distributed stations, was 3.03 inches, or a deficiency of 0.96 inch below the normal. The greatest monthly total was 6.39 inches at Phoenixville, while the least, 1.03 inches, was reported from Meadville. The greatest amount reported in any 24 consecutive hours was 2.70 inches at Phoenixville on the 24-25th.

GEORGE S. BLISS, Meteorologist.  
PHILADELPHIA, PA.

VOL. XXXV. JUNE, 1930. No. 6

## GENERAL SUMMARY.

Temperatures and precipitation for June averaged near the normal, but the temperature extremes were greater than usual. A minimum of 22°, within 2° of the June record, occurred at Somerset on the 1st. On that date freezing occurred over large areas in the northern and western portions of the State, and vegetation was frozen to a serious extent. It became necessary to replant a large portion of the corn in those regions. A drought condition, which began about the middle of May, extended over the first five days of June, and became severe enough to stunt the growth of crops. On the 6th local showers began and became more numerous until the 9th and 10th when heavy general rains furnished the much needed relief. During the remainder of the month the rainfall was ample, and crops of all kinds improved steadily. Good crops of wheat and rye ripened earlier than usual, and were ready for harvest at the close of the month. Corn made a fine growth, and first plantings were good to excellent. Potatoes and tobacco were reported to be better than average crops. Potato beetles were unusually numerous in some sections, and required extra work in spraying. Oats headed on rather short straw, but promised to be about an average crop. Orchard fruits were considerably below the average. Apples were estimated to portend about 55 percent of an average crop, and peaches less than a third of a crop. The month was comparatively free from damaging storms until the 26th when severe thunderstorms occurred in the central and eastern portions of the State. Some damage was done by hail, while the winds destroyed many trees and beat down considerable grain. A farmer near Carlisle was killed by lightning. At Bridgeport, near Norristown, many buildings were unroofed, possibly by tornadic action.

## TEMPERATURE.

The mean temperature for the State, as shown by reports from 88 stations, was 69.1°, which is 0.9° warmer than the June normal. The highest mean, 75.4°, was recorded at Philadelphia-Germantown, and the lowest, 60.5°, was reported from Elk Lick. The highest temperature for the month was 100°, recorded at Holtwood on the 5th. The lowest for the month was 22°, at Somerset on the 1st. The greatest daily range of temperature was 54° at Hyndman on the 2d and 3d.

## PRECIPITATION.

The average precipitation for the State as shown from reports of 133 stations, was 4.20 inches, which is an excess of 0.10 inch as compared with the June normal. The greatest monthly amount was 13.02 inches at Center Hall, while the least was 1.56 inches at Pottstown. The greatest amount recorded in any 24 consecutive hours was 5.75 inches at Center Hall on the 26th.

# CLIMATOLOGICAL DATA.

PENNSYLVANIA SECTION.  
GEORGE S. BLISS, Meteorologist.  
PHILADELPHIA, PA.

VOL. XXXV. JULY, 1930. No. 7

## GENERAL SUMMARY.

Temperatures during the fore part of the month were mostly below the normal, but the last ten days were intensely hot, and the month closed with a moderate temperature excess. Light frost occurred at some places on the 15th. A maximum temperature of 106 degrees at Phoenixville on the 21st was within one degree of the July record for the entire State. The rainfall was slightly more than one-half of the July normal, and a drought condition, that had been slowly accumulating in the greater portion of the State since the middle of May, was greatly intensified. At the close of the month the conditions were becoming alarming. The ponds and small streams were drying up, and the larger streams were very low. Many pastures had failed, and were beginning to turn brown. Corn was hit just as the ears were beginning to form, and in some sections it would make nothing more than fodder. Late potatoes were setting, and were seriously stunted. Truck crops were practically at a standstill. Orchard fruits were dropping from the trees. Apples promised little more than half, and peaches less than a third of a normal yield. Pears seemed to be least affected of all of the orchard fruits, and the outlook was for nearly a full crop. Hailstorms seemed to do more than the usual amount of damage, especially in the central and eastern counties, during the fore part of the month. Severe electrical storms occurred in various parts of the State from the 20th to the 24th. In several instances the winds were said to have been rotary in character. This was probably true of the storm that occurred in the vicinity of Allentown on the 22d. However, some of the storms that were reported as rotary were also said to have covered paths four to five miles in width, and it is questionable if a funnel cloud was present. Taken as a whole, July was an exceedingly unfavorable and disagreeable month.

## TEMPERATURE.

The mean temperature of the State as shown by reports from 89 stations, was 73.0°, which is 1.1° higher than the July normal. The highest monthly mean was 79.8° at Holtwood, and the lowest was 65.4° at Gouldsboro. The highest temperature recorded during the month was 106°, at Phoenixville on the 21st, while the lowest was 33° at Somerset on the 15th. The greatest daily range of temperature was 52° at Brookville on the 28th.

## PRECIPITATION.

The average precipitation for the State, as deduced from observations taken at 134 well-distributed stations, was 2.23 inches, which is 2.12 inches less than the normal for the month. The greatest monthly amount was 6.46 inches at Bethlehem, and the least, 0.17 inch fell at Arendtsville. The greatest amount recorded in any 24 consecutive hours was 3.29 inches, at Bethlehem on the 9-10th.

## SUNSHINE, HUMIDITY AND WINDS

# CLIMATOLOGICAL DATA.

## PENNSYLVANIA SECTION.

GEORGE S. BLISS, Meteorologist.  
PHILADELPHIA, PA.

VOL. XXXV. AUGUST, 1930. No. 8

### GENERAL SUMMARY.

This was the driest August during the last 43 years, and followed upon drought conditions that were becoming serious in a large portion of the State at the close of July. The rainfall was less than one inch in fully one-half of the State, comprising most of the central and about one-half of the western counties. There was almost no rain until the 15th when a three days period of light to moderate showers served to check the progress of the drought, but was not enough to effectively break it. During the remainder of the month the rains were mostly light and scattered, and the drought again increased in severity. The most favored region was comprised in the Delaware drainage basin. High temperatures during the first ten days and during the last week helped to make the drought more severe. The middle of the month was unseasonably cool with frosts and freezing in some places. Pastures and meadows dried up and many turned brown early in the month. The second cutting of hay was extremely light, and in many districts it was not worth harvesting. Corn was badly stunted, and a large portion of the crop failed to develop ears, while its value as a fodder crop was greatly reduced. Late potatoes developed prematurely in about three-fourths of the State, and were a very light crop. They were a fair crop at most places in the Delaware basin. Truck crops were stunted and the quality was seriously affected, but the supply seemed to be enough to meet the demands. Tobacco deteriorated from an unusually promising crop early in the season to one of the poorest in recent years. The water supply was low. Small streams and shallow wells became dry, and storage reservoirs were the lowest for many years. Fall plowing made very slow progress, and was almost impossible in some sections.

### TEMPERATURE.

The mean temperature for the State, as deduced from reports of 88 stations, was 70.3°, which is 0.3° above the normal August temperature. The highest monthly mean was 76.6° at Holtwood and the lowest was 63.3° at Gouldsboro and Somerset. The highest temperature recorded during the month was 108°, at Carlisle on the 4th, and the lowest was 29°, at Somerset on the 12th. The greatest daily range of temperature was 56°, at Hyndman on the 3d.

### PRECIPITATION.

The average precipitation for the State, as shown by observations taken at 133 stations, was 1.47 inches, a deficiency of 2.76 inches as compared with the monthly normal. The greatest monthly amount was 4.12 inches, at Kregar, while the least amount was 0.29 inch at Sunbury. The greatest amount recorded in any 24 consecutive hours was 1.96 inches at Pleasant Mount on the 23d.

## SUNSHINE, HUMIDITY AND WINDS

VOL. XXXV. SEPTEMBER, 1930. No. 9

## GENERAL SUMMARY.

Temperatures were above the normal almost constantly with wide departures on eight or ten dates, when the heat was very oppressive. However, a sharp drop occurred near the close of the month, and frost was reported at many stations on the 29th and 30th. The highest temperature for the State, 101°, just equaled the previous high record for September that was made in 1929. Good rains occurred in several localities, but covered a comparatively small portion of the State as a whole, in which the rainfall averaged a little more than two-thirds of the September normal. In the favored localities, the pastures and late truck crops were revived and greatly improved, but the rains were too late to materially help the corn crop, or much of the late potato crop. In general the drought conditions were further intensified during the month, and became more or less alarming. The soil in fully one-half of the State was too dry for plowing, and fall seeding, which is usually in progress during the last half of the month, was postponed in most sections awaiting more favorable conditions. Wherever good rains occurred the showers were generally intense and severe, and considerable damage was done by wind and lightning. A severe thunderstorm occurred at Selinsgrove on the 1st, and damage by lightning was estimated at upwards of \$35,000. At York a large barn was struck and burned on the same date, together with all of its contents, the loss being reported as \$10,000. Severe thunderstorms occurred in Harrisburg and vicinity on the 2d, and several buildings were struck and damaged by lightning. In nearby country districts several barns were burned and some stock was killed. A severe storm passed over the northern portion of Philadelphia on the 16th, uprooting many large trees and damaging numerous buildings. A funnel cloud was observed at Germantown in this storm, and was reported by two persons.

## TEMPERATURE.

The mean temperature for the State, as shown by reports from 90 stations, was 67.8°, an excess of 3.8° as compared with the September normal. The highest monthly mean was 76.2°, at Holtwood, and the lowest, 60.2° at Gouldsboro. Extremes for the month ranged from a maximum of 101°, at Arendtsville on the 2d, to a minimum of 27°, at Somerset on the 29th. The greatest daily range of temperature was 57°, at Clearfield on the 27th.

## PRECIPITATION.

The average precipitation for the State, as determined by the reports from 136 well-distributed stations, was 2.45 inches, which is 1.03 inches less than the monthly normal. The greatest monthly amount was 7.01 inches, at Montrose, while the lowest, 0.64 inch, was reported from Herrs Island Dam. The greatest amount recorded in any 24 consecutive hours was 2.95 inches, at York on the 13th.

PHILADELPHIA, PA.

VOL. XXXV. OCTOBER, 1930. No. 10

## GENERAL SUMMARY.

Temperatures were mostly seasonable, and the comparatively small accumulated departure was on the low side. Frosts and freezing were general at the end of the third and beginning of the fourth weeks, and truck crops and other tender vegetation were nipped. Local freezing had occurred in the mountain districts and the northern counties earlier in the season. The rainfall was less than one-third of the October normal, and the drought which had steadily accumulated during the summer and early autumn was further intensified. At the end of the month the accumulated deficiencies ranged from 20 to 35 percent of the normal rainfall for the season to date. Most of the deficiency accumulated during the growing season, and the chief damage to crops occurred before the October shortage merged into the problem. However, the October shortage seriously affected the winter grains and the water supply. In normal years, most of the winter grain in Pennsylvania is seeded during the last ten days of September, but this season the ground was too dry and hard and seeding was delayed. There was almost no rain during the first half of October, and the soil condition became worse instead of better. Moderate rains were fairly general from the 15th to 18th inclusive, and put the top soil temporarily in fair condition. Some seeding was done after this time. The result was that earlier sown fields came up spotted, while the grain that came up late in the month was not in a fair way to become well rooted for winter. At the end of the month the water supply was extremely low. Many small streams and shallow wells were dry, and storage reservoirs were the lowest for many years. The month was free from severe local storms, and weather in general was highly favorable for outdoor work of all kinds.

## TEMPERATURE.

The mean temperature for the State, as shown by reports from 90 stations, was 50.8°, a deficiency of 1.6° as compared with the October normal. The highest monthly mean was 57.4°, at Holtwood, and the lowest, 43.8° at Elk Lick. Extremes for the month ranged from a maximum of 93°, at Brookville on the 15th, to a minimum of 9°, at Somerset on the 22d. The greatest daily range of temperature was 54°, at Brookville on the 15th.

## PRECIPITATION.

The average precipitation for the State, as determined by the reports from 136 well distributed stations, was 0.99 inch, which is 2.19 inches less than the monthly normal. The greatest monthly amount was 3.33 inches, at Westford, while the lowest, 0.11 inch, was reported from Harrisburg (Weather Bureau). The greatest amount recorded in any 24 consecutive hours was 1.31 inches, at Meadville on the 8-9th. The monthly average snowfall was 0.2 inch, which is 0.1 inch above the normal. The greatest monthly snowfall occurred at Erie and was 4.6 inches, from which place also was reported the greatest 24-hour fall of 3.2 inches, which occurred on the 18-19th.

PHILADELPHIA, PA.

VOL. XXXV. NOVEMBER, 1930. No. 11

## GENERAL SUMMARY.

Twelve days of mostly seasonable temperatures were followed by twelve days with a constant and fairly large excess. A short cold period occurred from the 27th to the 29th inclusive, accompanied by snows over a large portion of the State. During this period a new record was established for low November temperature in the State with a minimum of 15° below zero at Somerset on the 29th. The snow cover melted rapidly during the rains and rising temperature of the 30th, and had disappeared from most places at the close of the month. The precipitation for the month was a little more than one-half of the November normal, and there was no appreciable amount of snow in the southeastern counties. Most of the rains occurred from the 12th to the 18th inclusive. They were heavy enough to soak the top soil fairly well, and probably helped the winter grains to some extent, although growth had nearly ceased. Many fields were spotted, owing to a poor germination of the seed, and of that which came up the growth was so slow that much of it was not well rooted and well established to withstand the winter weather. The rains were not heavy enough to materially relieve the water shortage in any region, and for the State as a whole the condition gradually became more acute and alarming. Many springs and shallow wells were dry, and thousands of families were compelled to haul water for domestic uses. The month was free from severe or damaging storms, and much fine weather was favorable for outdoor work. Corn husking was nearly finished at the close of the month, and most of the fodder was hauled in from the fields. Building and construction work of all kinds made fair progress during the month. Considered as a whole, it was more pleasant and agreeable than the average November.

## TEMPERATURE.

The mean temperature for the State, as shown by reports from 89 stations, was 42.0°, or 1.0° above the November normal. The highest monthly mean was 47.6°, at Philadelphia Weather Bureau, and the lowest 34.8°, at Elk Lick. Extremes for the month ranged from a maximum of 75°, at Newell on the 21st, to a minimum of -15° at Somerset on the 29th. The greatest daily range of temperature was 52° at Huntingdon on the 8th.

## PRECIPITATION.

The average precipitation, from rain, sleet and melted snow, for the State, as deduced from observations made at 132 stations, was 1.48 inches, which is 1.33 inches less than normal for the month. The greatest monthly amount was 4.29 inches at Mount Pocono, while the least, 0.22 inch, fell at Ansonia. The greatest amount recorded in any 24 consecutive hours was 1.50 inches at Westford on the 30th. Snowfall averaged 2.3 inches, compared with a normal November amount of 2.6 inches. The greatest monthly total was 20.0 inches at Meadville and the greatest 24-hour fall was 9.0 inches at Linesville on the 26-27th.

## CLIMATOLOGICAL DATA.

## PENNSYLVANIA SECTION.

GEORGE S. BLISS, Meteorologist.

PHILADELPHIA, PA.

Vol. XXXV.

DECEMBER, 1930.

No. 12

## GENERAL SUMMARY.

December, as a whole, was moderately cold, the mean temperature being slightly below the normal. A moderate temperature excess accumulated during the first two weeks, but was more than counter-balanced during the remainder of the month. The extremes were less than usual. The precipitation averaged a little more than two-thirds of the December normal, and was very unevenly distributed. Most of it was rain in the south-eastern counties. Fairly heavy snows occurred in the north-western and northeastern counties and in Somerset County, being as much as two feet in some places. The precipitation, generally, was about enough to prevent a further intensification of the drought. In some sections the surface water supply was replenished in a satisfactory manner. Small streams started to flow again, and ponds were partly filled. A few places reported the drought as being still critical at the end of the month. In no region did the new water supply affect wells and springs that had gone dry. Water hauling for domestic uses continued at many places throughout the month. The winter grains were poor to fair, there being about as large an acreage in the one classification as in the other. Much grain was sown late last fall, the work being delayed in the hope that rains would put the top soil in better condition. The soil remained so dry that the seed was slow in germination, and a large amount failed to grow. This resulted in many spotted fields, and much of the grain did not get properly rooted before cold weather stopped its growth. The lack of snow covering in the chief wheat growing regions contributed further to the unfavorable conditions. No severe local storms were reported during the month. Outdoor work generally made fair progress. The main highways were mostly in good condition throughout the month.

## TEMPERATURE.

The mean temperature for the State, as shown by reports from 92 stations, was 30.0°, or 1.1° below the December normal. The highest monthly mean was 37.6°, at Marcus Hook, and the lowest 23.4°, at Gouldsboro. The highest recorded during the month was 59°, at York on the 10th, and the lowest was -15°, at Somerset on the 25th. The greatest daily range of temperature was 52°, at Somerset on the 25th.

## PRECIPITATION.

The average precipitation, from rain, sleet and melted snow, for the State, computed from reports of 136-well distributed stations, was 2.29 inches, which is 0.94 inch less than normal for the month. The greatest monthly amount was 4.06 inches at Warren, and the least 0.82 inch at Zelienople. The greatest amount recorded in any 24 consecutive hours was 2.49 inches at New Park on the 26-27th.

Snowfall averaged 6.8 inches, compared with a December normal of 9.2. The greatest total snowfall for the month was 25.0 inches at Freeland, while the greatest 24-hour fall, 12.0 inches, occurred at Lakeville on the 26-27th.

VOL. XXXV. ANNUAL SUMMARY, 1930. No. 13.

GENERAL SUMMARY.

The outstanding feature for the year was the unprecedented drought that developed chiefly during the last six months. At the end of June there was an accumulated deficiency in rainfall of five inches or more in about one-fourth of the State. The dry regions comprised Berks, Lebanon, Lehigh, and Carbon counties in the eastern, and Adams, Franklin, Fulton, Bedford, Somerset, Cambria, Blair, and Huntingdon counties in the south-central portions of the State respectively. Elsewhere the deficiencies were comparatively small, while there was a small excess in some of the northern counties. During the next four months, ending with October, the deficiency increased in those dry regions to fifteen inches or more, and to ten inches or more in fully three-fourths of the State. The average deficiency for the State, during those four months was 8.10 inches, or fifty-three per cent of the normal. Small streams and ponds, shallow wells and thousands of springs dried up completely, and in many regions water was hauled for domestic uses, sometimes for long distances. All late maturing crops suffered severely. The winter grains and the first cutting of hay matured in June, and were not materially affected. In some sections the wheat crop was unusually good both in quality and yield. Early varieties of potatoes that were being dug near the end of July and early in August were mostly good excepting in the dry regions above mentioned. The corn crop, the second cutting of hay, late potatoes, and all late truck crops have a different story to tell, as they were almost a complete failure in the greater portion of the State. Thousands of acres of corn were almost devoid of ears, or developed mere nubbins, and were valuable only for ensilage. The corn crop as a whole was the poorest ever known. A large portion of the second hay crop was not worth cutting, and the only redeeming feature of the situation was the fact that the dry weather enabled the light crop to be cured and gathered with extremely small losses. Intense heat began shortly after the middle of July and prevailed most of the time until the end of September. This increased the devastating effects of the drought. Pastures began to turn brown in many sections early in September, and it became necessary to feed ensilage to the stock. The drought did not end with the crop growing season, but continued during the remainder of the year. The seeding of winter grains was delayed much later than usual in the hope that rains would put the top soil in better condition. The germination of the seed was slow, and the grain came up in patches. It did not have time to become well rooted and well established before low temperatures stopped the growth. At the end of the year the condition of the winter grains was the poorest for many years. Owing to late killing frosts in spring, the fruit crop was one of the lightest for the last ten years.

COMPARATIVE ANNUAL DATA FOR THE STATE

| Year | Temperature |         |        | Average precipitation | Average snowfall | Year | Temperature |         |        | Average precipitation | Average snowfall |

PENNSYLVANIA SECTION.  
GEORGE S. BLISS, Meteorologist.  
PHILADELPHIA, PA.

VOL. XXXVI.

JANUARY, 1931.

No. 1

## GENERAL SUMMARY.

The temperature was above the normal about two-thirds of the time in January. The cold periods were of short duration, and there were no cold waves. Frost did not penetrate the soil deeply, and considerable plowing was done during the month. The precipitation averaged less than half of the January normal. Only a few counties received as much as two inches for the month. The snowfall was generally light or moderate, and the fields were bare of snow cover a large part of the time. The conditions were mostly favorable for out-door work, which made fair progress. Winter grains were the poorest for many years, and were generally reported as being "poor" to "fair". Most sections of the State were free from severe or damaging storms, but a local storm of great intensity occurred at Uniontown and vicinity on the 5th. Some of the newspapers reported it as being a tornado, but trained local observers said that there was no funnel cloud, and that the winds were all straight line in effect. The winds did considerable damage over a path about two miles in width, which is several times wider than the path of a large tornado. It was of a type that is generally known in Pennsylvania as a "mountain storm". Wind instruments of the U. S. Army at Burgess Field recorded an extreme velocity of 102 miles per hour for two or three minutes, and the wind blew at a velocity of 80 to 90 miles per hour from about 11:30 a. m. until 12:30 p. m. Many buildings were unroofed, and a few were completely wrecked. Many miles of telephone, telegraph, and electric light wires were torn down, and live wires did damage in some places. Plate glass in Uniontown suffered severely. The total property loss was conservatively estimated at upwards of \$100,000. There was no loss of life, but many persons received minor injuries.

## TEMPERATURE.

The mean temperature for the State, as shown by reports from 89 stations, was 30.0°, which is 2.1° above the January normal. The highest monthly mean was 36.2°, at Philadelphia-Weather Bureau and Marcus Hook, and the lowest 21.0°, at Gouldsboro. The highest temperature recorded during the month was 65°, at Hyndman on the 25th, while the lowest, -12°, occurred at Gouldsboro on the 23d. The greatest daily range of temperature was 46°, at Brookville on the 2d.

## PRECIPITATION.

The average precipitation for the State, as deduced from the observations taken at 143 well-distributed stations, was 1.46 inches; a deficiency of 1.79 inches as compared with the normal. Monthly totals ranged from a maximum of 2.66 inches at Pleasant Mount to a minimum of 0.49 inch at Newell and McKeesport. The greatest amount recorded in any 24 consecutive hours was 1.50 inches at Stroudsburg on the 5-6th. Snowfall averaged 4.4 inches, as compared with a January normal of 11.7 inches. The greatest monthly amount was 19.5 inches at Pleasant Mount. The greatest 24-hour snowfall was 10.0 inches at Mount Pocono on the 11-12th.

VOL. XXXVI.

FEBRUARY, 1931.

No. 2

GENERAL SUMMARY.

February was an unusually pleasant and agreeable winter month. The temperatures averaged well above the normal without the usual extremes. Last year the highest February temperature for the State was 80°, and the lowest was 18° below zero. This year the highest was 66°, and the lowest was 16° below zero. The maximum temperature was recorded at most stations on the 28th, while the minima occurred on the 3d or the 11th. There was no general cold wave during the month. The precipitation averaged exactly two-thirds of the February normal, and had the effect of further intensifying the water shortage. The moisture was generally enough to keep the top soil in good condition, but it did not penetrate deeply enough to help the wells and springs. Ponds and small streams were replenished to some extent. Most of the precipitation occurred during the middle portion of the month, there being very little in the first six days or during the last week. In the southeastern counties the precipitation was mostly in the form of rain, the snowfall being very light. The fields were bare of snow cover the greater portion of the month. There was not much frost in the ground, especially across the southern half of the State, and a large amount of plowing was done. Outdoor work of all kinds made fair to good progress. The temperatures were high enough a large part of the time to permit concrete construction. The winter grains were mostly reported as being poor to fair. A large acreage was sown so late last autumn that the grain did not become well rooted before cold weather stopped its growth. Some early sown fields were in fairly good condition, but the ground was so dry that most of the early seedings came up spotted.

TEMPERATURE.

The mean temperature for the State, as deduced from observations taken at 88 stations, was 31.9°, which is 3.8° in excess of the February normal. The highest monthly mean was 37.4°, at Philadelphia Weather Bureau, and the lowest was 21.8°, at Montrose. Extremes of temperature for the month ranged from a maximum of 66° at Claysville, Donora and Uniontown on the 28th, to a minimum of -16° at Hawley on the 11th. The greatest daily range of temperature was 54° at Genesee on the 3d.

PRECIPITATION.

The average precipitation for the State, as determined from reports of 142 well-distributed stations, was 1.98 inches, which is 0.99 inch less than the normal for the month. The greatest monthly amount was 3.61 inches at Elk Lick, while Erie, with 0.87 inch, reported the smallest total. The greatest amount recorded in any 24 consecutive hours was 1.40 inches at New Park on the 9th. Snowfall for the month averaged 5.2 inches, which is less than half the normal February total of 10.9 inches. The greatest monthly snowfall was 23.4 inches at Pleasant Mount, and the greatest 24-hour snowfall was 9.0 inches, at Hawley on the 9th.

PENNSYLVANIA SECTION.  
GEORGE S. BLISS, Meteorologist.  
PHILADELPHIA, PA.

VOL. XXXVI.

MARCH, 1931.

No. 3

## GENERAL SUMMARY.

The temperatures averaged a little below the normal in nearly all parts of the State, excepting the five southeastern counties. The greatest deficiencies were in the western half of the State. There were no cold waves and no unusual extremes. The precipitation averaged about fifteen percent below the March normal with the greatest deficiencies in the western third of the State, and with a slight to moderate excess at many of the eastern stations. The snowfall averaged close to the normal and was heavier generally than it was during either January or February. Most of the snow in the central and western portions of the State fell from the 8th to the 10th inclusive, while in the eastern counties the heaviest snowfall occurred from the 16th to the 19th inclusive. In the northern tier of counties the ground was snow covered about one-half of the month, but elsewhere it generally melted in from four to six days. In Philadelphia and vicinity it mostly melted as it fell, and the remainder within 24 hours. The melting snow replenished the surface water supply, soaking the top soil quite thoroughly to the depth of a foot or more, and filling the ponds and small streams. In some places it restored springs and shallow wells, but generally speaking it did not penetrate the deep soil. At the close of the month the top soil was in good condition for plowing and seeding, but was not in a condition to withstand a drought. Oats seeding was beginning in a few places. The winter grains were reported as being poor to fair, and the average condition was the poorest for many years. It was evident that many thousands of acres would have to be plowed up and planted to other products. There was much more winter killing of clover than usual, and a large portion of the clover lands were in a condition to be plowed up. The pastures were turning green at the end of the month, but many were patchy and it was evident that considerable grass was also winter killed. Orchard fruits seemed to have come through the winter in generally good condition. Most of them were dormant sprayed during the month of March. The sunshine was somewhat below the March normal. There were no severe or damaging storms, but the total wind movement for the month was high.

## TEMPERATURE.

The mean temperature for the State, as shown by reports from 89 stations, was 36.3°; a deficiency of 1.4° from the March nor-

mal. Monthly mean temperatures ranged from 44.0° at Marcus Hook to 29.2° at Elk Lick. The highest temperature recorded during the month was 69°, at Gettysburg on the 27th, and the lowest 10° at Hawley on the 3d, and at Coudersport and Genesee on the 21st. The greatest daily range of temperature was 41°, at Brookville on the 1st.

## PRECIPITATION.

The average precipitation for the State, as determined from observations made at 144 well-distributed stations, was 2.96 inches; or a deficiency of 0.48 inch compared with the normal for March. The greatest monthly amount was 5.72 inches at New Park, while the lowest, 0.70 inch, was recorded at Montrose. The greatest amount recorded in any 24 consecutive hours was 2.10 inches on the 28th at Altoona. Snowfall averaged 6.6 inches, which is 0.3 inch less than normal. The greatest monthly snowfall was 22.0 inches at Elk Lick. The greatest 24-hour snowfall, 11.0 inches, fell at New Park on the 16th.

## COMPARATIVE DATA FOR MARCH

| Year                     | Temperature |         |        | Precipitation |          |       | No. of days |               |        |                       |

VOL. XXXVI.

APRIL, 1931.

No. 4

## GENERAL SUMMARY.

April was very nearly a normal month as regards both temperature and precipitation, and was generally favorable for agriculture with the exception of a cold period with widespread frosts near the end of the month. The frost damage was confined chiefly to valley lands and to locations having poor air drainage. In those places, tender vegetation was nipped, and orchard fruits were damaged to a greater or less extent. However, the fruit that was killed was a comparatively small portion of the total crop. Good soaking rains were frequent and general during the first week. They supplemented fairly heavy rains that occurred near the end of March, and replenished the surface water supply. The soil was fairly well soaked to a depth of a foot or more, ponds were filled, and a good flow of water was established in all of the streams. This surface water gradually seeped away, due to the dry conditions of the deep soil, and the stages of the streams slowly subsided to the end of the month despite the fairly heavy rains that occurred during the last decade. From the 12th to the 21st inclusive the sunshine was almost 100 percent of the possible. This period was highly favorable for field work which made good progress, and it stimulated a rapid growth in crops. In about one-third of the State, comprising the southeastern portion, there was practically no snow during the month. There were some heavy local snows in the northwestern counties. The heaviest snows occurred in a narrow curved belt including Bradford, Clearfield, and Somerset counties. Towanda reported a snowfall of sixteen inches on the 6-7th. It was a moist snow and melted within 48 hours. Clearfield and Somerset counties reported a foot or more of snow for the month, but in each case it was a total of three snow storms instead of falling on a single date as it did at Towanda. None of the snows remained on the ground more than 24 to 36 hours. There were no severe or damaging storms during the month. Moderate thunderstorms occurred on three dates in the western portion of the State, but only on one date in the eastern counties. At the close of the month farm work was reported to be at about an average stage of advancement. Crops were a little backward in the western counties, and nearly normal elsewhere.

## TEMPERATURE.

The mean temperature for the State, as shown by reports from 89 stations, was 48.4°, which is 0.3° less than the April normal. The highest monthly mean was 54.6° at Marcus Hook,

and the lowest was 41.4° at Montrose. Extremes for the month ranged from a maximum of 85° at Hyndman, on the 9th, and also at Phoenixville, on the 15th, to a minimum of 16° at Ridgeway, on the 24th. The greatest daily range of temperature was 60° at Clearfield, on the 24th.

## PRECIPITATION.

The average precipitation for the State, as determined from observations taken at 143 stations, was 3.33 inches, which is a deficiency of 0.11 inch as compared with the normal for the month. The greatest monthly total was 5.93 inches at Lycipus, while the least, 1.00 inch, was reported from Montrose. The greatest amount recorded in any 24-hour period was 1.80 inches, at Altoona on the 22-23d. Snowfall for the State averaged 2.3 inches, which is 0.2 inch less than normal. The greatest monthly total was 17.2 inches at Towanda, which station also reported the greatest 24-hour amount: 16.0 inches in the storm of April 6-7th.

## COMPARATIVE DATA FOR APRIL.

## PENNSYLVANIA SECTION.

GEORGE S. BLISS, Meteorologist.  
PHILADELPHIA, PA.

VOL. XXXVI.

MAY, 1931.

No. 5

### GENERAL SUMMARY.

The month of May started with general frosts, and with severe freezing in a large portion of the State. Thereafter the conditions were mostly seasonable, and the mean for the month was slightly above the May normal. The winter grains were not injured by the frosts, and most of the other crops were not advanced enough to suffer materially. The soil was chilled, and crop growth was retarded to some extent. It was at first believed that the orchard fruits were hard hit, but it later developed that damage was confined to valley lands in which the air drainage was poor. The rainfall was generally heavy, the average being about thirty-five per cent above the May normal. The heaviest rainfalls occurred, in most cases, in the driest regions where the effects of the long continued drought had not been overcome. They were sufficient to amply restore the surface water supply, and in most places the deep soil seemed to assume a more nearly normal condition. Springs and shallow wells came back, and the surface soil retained its moisture better than it did last fall. Light snow fell in the northeastern portion of the State on the 23d and 24th with 2.0 inches reported from Montrose and Freeland. Strong winds prevailed during the snowfall, and no damage to growing crops resulted. Corn planting was delayed by the wet condition of the fields, and was not finished in the northern counties at the close of the month. Winter wheat and rye made a good growth, and rye was mostly headed. Both grains developed heavy straw and fairly large heads. Oats made a fair growth and was generally looking good, and was reported as better than an average crop. Pastures were spotted in some sections, and were backward in the greater portion of the State, but improved materially during the month. Alfalfa was exceptionally good, but clover was badly spotted in some sections. The month seemed to have its full share of severe local storms. Thunderstorms were especially numerous in the western portion of the State. The worst storms of the month occurred on Decoration Day when considerable damage by wind and lightning was reported. The winds were most severe in the northeastern part of the State where many silos were blown down, buildings were unroofed, and large trees were uprooted. The lightning seemed to be most severe in the central portion of the State. A farmer near Johnstown was instantly killed by lightning on the 19th, and several other persons in that region were injured. Lightning did some damage at Montrose. A few hailstorms were reported with no serious damage.

### TEMPERATURE.

The mean temperature for the State, as shown by reports from 90 stations, was 59.8°, which is 0.4° above the normal for May.

The highest monthly mean was 66.6° at Marcus Hook, and the lowest, 52.1° at Mount Pocono. The highest temperature recorded during the month was 98° at Arendtsville on the 29th, while the lowest, 19°, was recorded at Brookville and Chambersville on the 1st. The greatest daily range of temperature for the month was 60° at Bradford on the 28th.

### PRECIPITATION.

The average precipitation for the State, based on the reports from 146 well-distributed stations, was 5.28 inches, or an excess of 1.38 inches above the normal. The greatest monthly total was 12.97 inches at Center Hall, while the least, 2.33 inches, was reported from Lancaster. The greatest amount recorded in any 24 consecutive hours was 3.75 inches at Center Hall on the 22-23d.

Snowfall averaged a trace, which is exactly normal. The greatest fall in 24 hours was 2.0 inches, which amount also represented the greatest for the month, occurring at Montrose and Freeland on the 23d-24th.

### COMPARATIVE DATA FOR MAY

| Year                     | Temperature |         |        | Precipitation |          |       | No. of days |               |        |                        |

Vol. XXXVI.

JUNE, 1931.

No. 6

## GENERAL SUMMARY.

June did not depart greatly from the normal in either temperature or precipitation, and the extremes were not unusual. The slight excess in temperature seemed to accumulate gradually through the month instead of piling up during a hot week as sometimes happens. The rainfall averaged about a half inch below the June normal, the deficiency being chiefly in the central counties where the rainfall in May was heavy. The distribution of rainfall was favorable for agriculture, and the weather for the month was generally good for field work. The cutting of alfalfa began about the middle of the month, and a good crop of hay was cured and gathered with small losses. Wheat and rye ripened rapidly during the last week, and harvest was beginning in the southern tier of counties at the close of the month. Both rye and wheat developed heavy straw and large heads, and gave evidence in many places of bumper crops. Corn seemed to be a little backward early in the month, but it began a more rapid growth during the third week, and was generally reported good at the end of the month. Pastures were also backward in some sections early in the month, but improved considerably. Potatoes were good in nearly all parts of the State. Aphids did considerable damage in some places, but the crop as a whole was unusually promising. Tobacco was transplanted to the fields under good conditions of weather and soil, and was making a good showing. Truck crops were mostly good. Orchard fruits as a whole were the most promising of any crop in recent years. Cherries were especially good. There were numerous complaints that apples were falling from the trees, but there was no evidence that this condition was worse than in average seasons. Pears and peaches were generally good. Severe local storms were so numerous on the 6th and 7th as to cover nearly the whole State. Much damage was done by winds which uprooted thousands of large trees and unroofed many buildings. Some stock was killed by lightning and a few barns were burned. Hail did much damage in a few localities, and fields were badly washed in some sections by the excessive rains. The storms seemed to be most destructive in the central and northeastern counties. In some places the damage bore many indications of tornadoes, but no funnel clouds were reported. There seems to have been no loss of human life.

## TEMPERATURE.

The mean temperature for the State, as shown by reports from 90 stations, was 68.5°, which is 0.6° warmer than the June normal. The highest mean 74.6° was recorded at Marcus Hook, and the lowest, 61.6°, was reported from Ridgway. The highest temperature for the month was 102°, recorded at Hyndman on the 20th, and at Catawissa and Lewisburg on the 30th. The lowest for the month was 28°, at Ridgway on the 2d. The greatest daily range of temperature was 53° at Catawissa on the 20th.

## PRECIPITATION.

The average precipitation for the State as shown by the reports of 144 stations, was 3.71 inches, which is a deficiency of 0.47 inch as compared with the June normal. The greatest monthly amount was 8.08 inches at Natrona, while the least was 1.23 inches at Greenville. The greatest amount recorded in any 24 consecutive hours was 3.35 inches at Warren on the 6-7th.

## COMPARATIVE DATA FOR JUNE

PENNSYLVANIA SECTION.  
GEORGE S. BLISS, Meteorologist.  
PHILADELPHIA, PA.

VOL. XXXVI.

JULY, 1931.

No. 7

## GENERAL SUMMARY.

July was hot, humid, and generally uncomfortable. With two exceptions, it was the hottest July during the 44 years period of the State Weather Service. In 1921 the July mean for the State was 0.7° higher, and in 1901 it was 1.2° higher than that of July this year. In each instance the rainfall was less, and the conditions were probably no more oppressive. The rainfall averaged about an inch above the July normal, and was very unevenly distributed. In some places excessive rains resulted in heavy damage, while in others the crops were stunted by drought. In the favored regions, which comprised much the greater portion of the State, the crop-growing conditions were excellent. Corn grew rapidly and made up fully for the somewhat backward condition that prevailed earlier in the season. A large portion of the crop was in tassel by the middle of the month, and eared up rapidly thereafter. At the close of the month the crop was rated above the ten-year average. Wheat harvest was getting under way in the southern counties at the beginning of the month. The straw was heavy, the heads large, and the grain of good quality. Threshing began about the middle of the month, and many large yields were reported. Oats developed a heavy straw, but the grain did not fill well, and yields were mostly below the average. Pastures and the hay crop were good excepting the dry regions. Early potatoes were good in yield and quality, and were being marketed during the last ten days of the month. The late crop suffered more from beetles and aphids which appeared rather suddenly in large numbers, and blight was reported in some sections. The fruit crop was the most promising for several years, although there were many complaints of apples falling from the trees. There seemed to be more than the usual number of severe local storms, especially in the central and eastern portions of the State. On July 1st severe thunderstorms were reported in Bradford, Cumberland, and Lancaster Counties with a total damage probably in excess of \$300,000. Many houses were unroofed in Lancaster and Lititz by the high winds, and hail did much damage to crops. On the 9th severe storms occurred in the north-central and northeastern counties, and heavy flood damage was reported from Sunbury and Scranton. On the 14th excessive rains occurred across the northern portion of Philadelphia and in adjacent regions with flood damage estimated to be in excess of a million dollars. On the 16th Pittsburgh experienced a severe windstorm, and on the 17th considerable damage by floods oc-

curred at Chambersburg, where a boy was killed by lightning.

## TEMPERATURE.

The mean temperature for the State, as shown by reports from 88 stations, was 75.2°, which is 3.2° higher than the July normal. The highest monthly mean was 81.6° at Marcus Hook, and the lowest was 66.8° at Ridgway. The highest temperature recorded was 105°, at Lock Haven on the 1st, and at Hyndman on the 2d, while the lowest was 39° at Ridgway on the 11th. The greatest daily range of temperature was 48° at Hyndman on the 1st.

## PRECIPITATION.

The average precipitation for the State, as deduced from observations taken at 143 well-distributed stations, was 5.28 inches, which is 0.99 inch above the normal for the month.. The greatest monthly amount was 13.28 inches at Center Hall, and the least, 1.81 inches at New Castle. The greatest amount recorded in any 24 consecutive hours was 5.88 inches, at Westgrove on the 9-10th.

## COMPARATIVE DATA FOR JULY

| Year                | Temperature |         |        | Precipitation |          |       | No. of days |               |        |                        |

VOL. XXXVI.

AUGUST, 1931.

No. 8

### GENERAL SUMMARY.

The average temperature excess for August was not large, but it accumulated chiefly during the first ten days following a hot July, and the persistent heat became decidedly enervating. The last half of the month was fairly comfortable in the western portion of the State, but the third week was uncomfortably warm in the southeastern counties. The rainfall distribution seems to have been more uneven than usual. In a general way the lighter rainfall occurred in a few northeastern and a few northwestern counties where the drought was severe enough to stunt the growth of crops, and to cut pastures short. In the eastern portion of the State fully one-half of the monthly rainfall occurred from the 9th to the 13th inclusive, but west of the mountains the rains grouped around four dates, namely the 3d, 10th, 19th and 27th. From a crop growing standpoint it was probably more favorable than the average August. A fine crop of corn developed, excepting a few of the driest counties where the ears were small, and the potato crop was reported good in nearly all parts of the State. It was apparent after the middle of the month that the following crops were likely to be better than the average: namely, corn, buckwheat, potatoes, tobacco, apples, peaches, pears, and grapes, while oats, hay, and pasturage were below the average. Peaches generally loaded the trees so heavily that where no thinning was done the fruit was small. There were about the usual number of severe local storms. On the 2d, heavy rains in the Johnstown region destroyed several bridges and flooded hundreds of basements, doing damage that was estimated at upwards of \$125,000. On the 10th a severe thunderstorm passed across the northern portion of Philadelphia, flooding hundreds of basements and a portion of the Broad Street subway. The damage was estimated at more than \$100,000. On the same date a mill in Reading was partly destroyed by lightning, electric service was disrupted, and heavy rains did considerable damage. The total loss was estimated at \$50,000. On the 28th a severe storm between Gettysburg, Pa. and Emmitsburg, Md. was very destructive over a narrow path, suggesting the work of a tornado, but its character could not be positively identified. The damage seems to have been \$10,000 or more.

### TEMPERATURE.

The mean temperature for the State, as deduced from reports

of 91 stations, was 71.1°, which is 1.1° in excess of the normal for August. The highest monthly mean was 78.2° at Holtwood, and the lowest was 64.0° at Gouldsboro. Extremes of temperature ranged from a maximum of 104°, at Holtwood on the 8th to a minimum of 40°, at Genesee on the 22d and also at Ridgway on the 23d. The greatest daily range of temperature was 45°, at Franklin on the 7th and 24th and also at Gordon on the 30th.

### PRECIPITATION.

The average precipitation for the State, as shown by reports from 145 stations, was 4.01 inches, which is 0.16 inch less than normal for the month. The greatest amount for the month was 8.78 inches at Kregar, while Franklin, with 1.30 inches, reported the least. The greatest amount recorded in any 24 consecutive hours was 5.18 inches at Center Hall during the storm of the 9th.

### COMPARATIVE DATA FOR AUGUST

GEORGE S. BLISS, Meteorologist.  
PHILADELPHIA, PA.

VOL. XXXVI.

SEPTEMBER, 1931.

No. 9.

## GENERAL SUMMARY.

September, as a whole, was intensely hot and moderately dry. The temperature mean of 69.1° was the highest for any September during the 44 years of the State Weather Service. A maximum of 104° was reported at Lykens on the 12th and at Holtwood on the 13th, and was the highest September temperature ever recorded in the State. The temperatures were constantly above the normal from the 1st to the 24th, inclusive, and at times the excess was as much as 15° or 16°. There was an unusually large number of days with maximum temperatures 90° or higher, while an extreme of 100° or higher was recorded at about one-half of the stations. Maximum temperatures of 100° or higher were recorded at several stations on more than one date. The winds were light a large part of the time and the heat was very oppressive. The temperature fell sharply after the 24th, and frost and freezing occurred at many places with no important damage. The rainfall was above the normal in most of the western counties, while there was a fairly large deficiency elsewhere, and a moderate deficiency in the mean for the State. In a few southeastern counties, and in a fairly large area in the central portion of the State, the rains were about one-half of the September normal. In these drier regions the crops matured rapidly, and sometimes prematurely, while pastures and other late feed became short and deteriorated in quality. Corn ripened rapidly, but generally not prematurely, and in the greater portion of the State it was considered as a bumper crop. Silo filling began early in the month, and was generally completed at about the end of the third week, at which time cutting and shocking were in full swing in the southern counties. Wheat seeding began about the middle of the month, and was well advanced at its close. The ground was too dry in some sections, but was in fair to good condition in the greater part of the State. Excepting the drier regions, the pastures held up well, and were providing ample feed at the close of the month. Oats threshing was practically finished in the northern counties by the middle of the month. The yields were moderate, and much of the grain was light. Late potatoes were generally reported as fair, and in sections where spraying was properly done the crop was good. Combined with an excellent early crop they promised to bring the total returns above the 10-year average. Late truck crops were mostly fair, but matured rapidly, especially in the drier regions. The tobacco crop was generally good, and was mostly cut and housed by the end of the third week. Peach gathering continued until about that time with one of the largest crops in recent years. Prices were so low that in many instances they barely covered the cost of gathering and marketing, leaving no profit for the grower. Thousands of bushels of fruit were allowed to go to waste. Apples were plentiful and of good quality, but fell from the trees more than usual in the northeastern portion of the State. Buckwheat harvest began

during the third week, and was generally reported as a good crop. The month was unusually free from severe or damaging local storms.

## TEMPERATURE.

The mean temperature for the State, as shown by the reports from 90 stations, was 69.1° an excess of 5.0° as compared with the September normal. The highest monthly mean was 76.8°, at Holtwood, and the lowest, 61.8° at Gouldsboro. Extremes for the month ranged from a maximum of 104°, at Lykens on the 12th and at Holtwood on the 13th, to a minimum of 29°, at Ridgway on the 29th and 30th and at Genesee on the 29th. The greatest daily range of temperature was 48°, at Franklin on the 9th.

## PRECIPITATION.

The average precipitation for the State, as determined by the reports from 146 well-distributed stations, was 3.15 inches, which is 0.31 inch less than the monthly normal. The greatest monthly amount was 6.65 inches, at Saltsburg, while the lowest, 0.74 inch, was reported from Marcus Hook. The greatest amount recorded in any 24 consecutive hours was 2.65 inches, at Butler on the 1st-2d.

## COMPARATIVE DATA FOR SEPTEMBER

OCTOBER, 1931.

No. 10.

GENERAL SUMMARY.

October was unusually warm, the mean temperature for the State being exceeded only four times during the 44 years of the State Weather Service. The greatest temperature excesses were recorded at stations in the eastern portion of the State, and Philadelphia established a new record for a high October mean. The mean of 62.6° was higher by 0.1° than the previous warmest October during the last 105 years. Most of the temperature excess accumulated during the first ten days, when the heat was nearly as oppressive as at any time in midsummer. However, the temperatures were on the high side of the normal about three-fourths of the time during the month. Frosts and freezing temperatures covered most of the State during short cold periods that centered about the 13th and 19th respectively, and killed most of the late truck crops. The rainfall was only a little more than one-half of the October normal, but was far from establishing any new records. It was nearly twice as much as the rainfall for October 1930. However, before the end of the month there were many complaints of a water shortage. Many observers stated that springs and wells were going dry that held up through the drought of 1930. The surface soil, as affecting crops, was in much better condition than last year, but evidence is accumulating that the loss of deep soil water in 1930 has never been made up, and that there is still a slow decrease in progress that will require a long rainy season to correct. The weather during the month was very favorable for field work. Wheat seeding was finished early in the month, and corn husking progressed rapidly. At the close of the month corn husking was about half done, and apple gathering was in full swing. The winter grains were up and generally looking good despite the shortage of rainfall. The apple crop was large, and the quality mostly good to excellent. Prices were very low, and fine apples sold in many orchards for fifty cents per bushel or less, while hundreds of bushels of the less desirable varieties were given away. Late truck crops were plentiful and good during the first half of the month. The corn and tobacco crops were unusually heavy, and better than the average in quality. Buckwheat was mostly threshed during the month, and seemed to be about an average crop. A third cutting of hay was made in many places, the yields being light, but the quality good. The stream stages were almost the same as those of last October, being a just little higher in the Ohio drainage area. There were about the usual number of thunderstorms, but none of them seemed to be severe, and no damage by high winds was reported.

TEMPERATURE.

The mean temperature for the State, as shown by the reports

from 88 stations, was 55.7°, an excess of 1.3° as compared with the October normal. The highest monthly mean was 64.4°, at Marcus Hook, and the lowest 48.5°, at Gouldsboro. Extremes for the month ranged from a maximum of 93°, at Holtwood on the 7th, to a minimum of 20°, at Ridgway on the 13th and 19th. The greatest daily range of temperature was 52°, at Clearfield on the 20th.

PRECIPITATION.

The average precipitation for the State, as determined by the reports from 143 well-distributed stations, was 1.83 inches, which is 1.43 inches less than the October normal. The greatest monthly amount was 4.30 inches, at Hamburg, while the least, 0.20 inch, was reported from Wellsboro. The greatest amount recorded in 24 consecutive hours was 2.11 inches, at Lebanon on the 8th. The monthly average snowfall was a trace, which is 0.3 inch less than the normal for the month. No measurable snow was reported, but several stations reported traces on the 16th, 17th, or 18th.

COMPARATIVE DATA FOR OCTOBER

| Year                     | Temperature |         |        | Precipitation |          |       | No. of days |               |        |                        |

## PENNSYLVANIA SECTION.

GEORGE S. BLISS, Meteorologist.

PHILADELPHIA, PA.

VOL. XXXVI.

NOVEMBER, 1931.

No. 11.

### GENERAL SUMMARY.

Although the first week of the month averaged nearly normal a long period of abnormally high temperatures, beginning with the 9th and ending with the 25th, during which 17-day period an average daily excess of nearly 15° was recorded, resulted in the highest average temperature experienced in Pennsylvania in November since State weather records were inaugurated. The last week of the month was marked by a return to near-normal conditions on the 26th and the first general State-wide snowfall of the season on the 27th. This snow averaged about three inches, but with a return to abnormally high temperature conditions on the 29th and 30th the snow-cover had almost entirely disappeared by the end of the month. Philadelphia's mean for the month, 54.0°, established a new record for any station in the State during November, the previous warmest being 52.4° at Lancaster in 1896. The abnormally warm weather resulted in many reports of budding of flowers as late as the 25th of the month. Precipitation, like that of October, was again subnormal, averaging but little more than fifty percent of the normal amount, and further increasing the water shortage. Many well and springs were reported dry for the first time in their history, although the snow and light rains of the last week improved conditions to a slight degree. The top soil, however, remained in fairly good condition. Due to the warm, humid conditions, much foggy weather occurred during the month, especially during the latter half. With the exception of some interruption due to the snow of the 27th the month was quite favorable for all out-of-door work and by the end of the month field work was about completed. In the cities, building operations suffered very little from inclement weather. Corn-husking and apple-gathering were completed during the first half of the month in all sections, and fall plowing was about completed in all parts of the State by the end of the month. No destructive storms were reported.

F. H. A.

### TEMPERATURE.

The mean temperature for the State, as shown by the reports from 89 stations, was 49.2°, or 8.0° above the November normal. The highest monthly mean was 54.0°, at Philadelphia,

and the lowest 42.5, at Gouldsboro. Extremes for the month ranged from a maximum of 80°, at Hyndman on the 12th, to a minimum of 12° at Mount Pocono on the 7th and 27th. The greatest daily range of temperature was 46° at Mauch Chunk on the 10th.

### PRECIPITATION.

The average precipitation, from rain, sleet and melted snow, for the State, as deduced from the observations of 145 stations, was 1.52 inches, which is 1.34 inches less than the November normal. The greatest monthly amount was 4.42 inches at Corry, while the least, 0.36 inch, fell at Reading. The greatest amount recorded in any 24 consecutive hours was 1.50 inches at Elk Lick on the 30th. Snowfall averaged 2.9 inches, compared with a normal November amount of 2.5 inches. The greatest monthly total was 3.0 inches at Clearfield, and the greatest 24-hour fall was 7.5 inches at Gouldsboro on the 27th.

### COMPARATIVE DATA FOR NOVEMBER

PENNSYLVANIA SECTION.

GEORGE S. BLISS, Meteorologist.

PHILADELPHIA, PA.

VOL. XXXVI.

DECEMBER, 1931.

No. 12.

## GENERAL SUMMARY.

This was an unusually mild December, its mean of 38.1° having been exceeded only three times in the forty-four years of the State Weather Service. At Philadelphia the mean temperature for the month was 44.2°, and has been exceeded only once in December during the last hundred years. Despite the mild conditions, no extremely high temperature was reached, and the State maximum of seventy degrees has been equaled or exceeded eighteen times in the last 44 years. The lowest temperature for the State was only one degree below zero, and it is seldom that we have so high a monthly minimum for December. On the other hand, a minimum of twenty-eight degrees below zero has been recorded in December in two of the last 44 years. In the southeastern counties the ground was free from frost the greater portion of the time, and considerable plowing was done. The precipitation, which was somewhat below the normal, was mostly in the form of rain. The snowfall averaged only slightly more than one inch for the State, and about one-third of the stations reported only a trace. The snow did not afford an effective covering for the winter grains at any time, but with no deep frost in the ground there was little need for such protection. Owing to the deficiency in rainfall, the streams were at moderate or low stages, and the water supply in the deep soil seemed to slowly diminish. There were many reports of wells and springs going dry that had never been known to fail. There were no long rainless periods during the month, and the top soil remained in fair to good condition, with the winter grains looking fine. The mild conditions were favorable for road work and for building construction, which made good progress. There was considerable cloudy weather, and the sunshine record was slightly below the December normal. There were no destructive storms during the month, and the highest wind velocity recorded in the State was 44 miles per hour at Philadelphia on the 14th. The Philadelphia records show a temperature excess for every month since October 1930.

## TEMPERATURE.

The mean temperature for the State, as shown by the reports from 90 stations, was 38.1°, or 7.0° above the December normal. The highest monthly mean was 44.6°, at Marcus Hook,

and the lowest 30.6° at Mount Pocono. The highest recorded during the month was 70° at Hanover on the 12th, and the lowest was -1°, at Coudersport on the 8th. The greatest daily range in temperature was 45°, at Hawley on the 3d.

## PRECIPITATION.

The average precipitation, from rain, sleet and melted snow, for the State, as deduced from the observations of 145 well-distributed stations, was 2.85 inches, which is 0.31 inch less than the normal for the month. The greatest monthly amount was 5.49 inches at Elk Lick, and the least was 1.27 inches at Reading. The greatest amount recorded in any 24 consecutive hours was 1.60 inches at Emporium on the 13th.

Snowfall averaged 1.1 inches, compared with a December normal of 7.9 inches. The greatest total snowfall for the month was 7.5 inches at Genesee, where also occurred the greatest 24-hour fall of 5.0 inches on the 7th.

## COMPARATIVE DATA FOR DECEMBER

| Year                     | Temperature |         |        | Precipitation |          |       | No. of days |               |        |                        |

VOL. XXXVI.

ANNUAL SUMMARY, 1931.

No. 13.

GENERAL SUMMARY.

The year as a whole was abnormally warm and dry. The mean temperature of 52.8° was the highest in 44 years records with the single exception of 1921 with a mean of 53.1°. March and April were the only months to show a temperature deficiency, and their departures were small. The precipitation was about 8.5 inches more than that of the preceding year, but was still about 5.0 inches below the normal. May and July were the only months with an excess of rainfall. The average snowfall of 22.5 inches was just a little more than one-half of the normal, and was the least for any year of record. January gave an excess in temperature of about two degrees. The cold periods were of short duration, and there were no cold waves. The rainfall and the snowfall were less than one-half of the normal, and the fields were bare of snow cover the greater portion of the time. February was a little warmer than January, and showed an excess of nearly four degrees. Frost did not penetrate the ground deeply at any time. The precipitation was two-thirds of the February normal with the snowfall a little more than one-half of the normal. March lined up a little better with a moderate deficiency in both temperature and precipitation, while the snowfall was close to the March average. However, across the southern portion of the State the fields were free from snow most of the time with little frost in the ground, and considerable plowing was done. April was approximately normal in all respects, and was favorable for agriculture with the exception of a cold period and widespread frosts near the close of the month. Heavy snows occurred in the northern tier of counties on the 6th and 7th, but melted quickly. May was nearly normal in temperature, but furnished the largest excess in rainfall of any month during the year. These rains were generally needed, and were very beneficial. The winter grains, which had been considered as poor to fair, made a rapid growth and a wonderful improvement. June was a generally favorable month. The greatest deficiencies in rainfall occurred where the May rains were heaviest. The winter grains filled well and ripened rapidly, and gave every indication of bumper crops. A heavy cutting of alfalfa was secured with small losses. July was excessively hot and the rainfall was moderately heavy, coming largely as severe thundershowers that did considerable damage in some places. Wheat harvest began early in the month, and proved to be a heavy crop. Corn grew rapidly and at the close of the month it was rated above the ten-year average. Early potatoes were good to excellent, while the fruit crop was the most promising for many years. These favorable conditions were followed by a hot and dry fall that was decidedly unfavorable for late crops and late feed. From September to December inclusive the temperatures averaged the highest for any corresponding period of record. September temperatures were constantly above the normal from the 1st to the 24th inclusive, and maximum temperatures above 100° were recorded at about one-half of the stations. The November mean was eight degrees above the normal, and the fifteen day period from the 9th to the 25th inclusive averaged nearly fifteen degrees above the normal. It was the warmest November of record. December was abnormally warm, but was not a record breaker as its mean of 38.1° has been exceeded three times. The snowfall was very light, averaging only 1.1 inches.

COMPARATIVE ANNUAL DATA FOR THE STATE

| Year | Temperature |         |        |                       |                  | Year | Temperature |         |        |                       |                  |

# CLIMATOLOGICAL DATA.

32

PENNSYLVANIA SECTION.

GEORGE S. BLISS, Meteorologist.

PHILADELPHIA, PA.

VOL. XXXVII.

JANUARY, 1932.

No. 1.

## GENERAL SUMMARY.

This was the warmest January of record for the State, the mean of 40.5 degrees exceeding the previous high record of 1890 by three degrees. At Philadelphia, for which many old records are available, the mean for the month was 46.2 degrees, and established a new high mean for the last hundred years. Despite the high mean, there were no record breaking maximum temperatures. The highest for the State was 79 degrees, and was exceeded in 1906 and 1914 with 85 and 81 degrees respectively. However, the State minimum of 9 degrees was the highest minimum of record. At Philadelphia the temperature was above the normal for every date excepting the last. The greatest excess was 32 degrees on the 13th. There was no freezing until the 31st, and lawns remained green. Many kinds of flowers were found in bloom, among which were dandelions, pansies, petunias, and japonica. The flowers, of course, were in isolated and well protected places. There was nothing outstanding in the precipitation record excepting the extremely small portion that occurred as snow. The average snowfall for the State, 1.3 inches, was the least for any January during the last forty-four years. There were seventeen counties in the southern portion of the State that received only traces of snow. The heaviest snowfall for the month was 11.0 inches in the extreme north-eastern corner of the State. With very little frost in the top soil, and none in the sub soil, the winter grains did not need a snow cover for protection. In the southeastern counties they continued to grow during the greater portion of the month, and were looking fine. Plowing continued intermittently during the month, and several places reported that the spring plowing was finished.

The conditions were favorable for road work, and for most kinds of building construction. There was an unusually strong wind movement occasioned by the large number of dates with moderate gales, although the extreme winds were not unusually high. Erie recorded a total wind movement of 12,072 miles, and Philadelphia a total of 10,148 miles. More than the usual number of thunderstorms were reported, and there was an excessively large number of foggy days. It was a freakish month in many respects, but on the whole it was pleasant and agreeable. Stock was turned out in the fields more than usual. The excess of about 30 per cent in rainfall was needed to replenish the water supply, and many wells and springs that went dry last fall were restored to use.

## TEMPERATURE.

The mean temperature for the State, as shown by the reports from 89 stations, was 40.5°, which is 12.6° above the January

normal. The highest monthly mean was 46.2°, at Philadelphia-Weather Bureau, and the lowest 33.0°, at Gouldsboro and Mount Pocono. The highest temperature recorded during the month was 79°, at Hanover and Hyndman on the 14th, while the lowest 9°, occurred at Mount Pocono on the 31st. The greatest daily range in temperature was 43° at Arendtsville on the 13th.

## PRECIPITATION.

The average precipitation, for the State, as deduced from the observations of 144 well-distributed stations, was 4.51 inches, an excess of 1.26 inches as compared with the normal. Monthly totals ranged from a maximum of 7.48 inches at Brookville, to a minimum of 1.98 inches at Center Hall. The greatest amount recorded in any 24 consecutive hours was 2.60 inches at Gouldsboro on the 6-7th. Snowfall averaged 1.3 inches, as compared with a January normal of 11.7 inches. The greatest monthly amount was 11.1 inches at Pleasant Mount, which place also reported the greatest 24-hour fall of 8.5 inches on the 1st-2d.

## COMPARATIVE DATA FOR JANUARY

| Year                     | Temperature |         |        | Precipitation |          |       | No. of days |               |        |                        |
|--------------------------|-------------|---------|--------|---------------|----------|-------|-------------|---------------|--------|------------------------|
